InterMine is an open source system to integrate many commonly used biological data sources and formats. It provides data through a web interface, comprehensive RESTful web services and client APIs for many programming languages.

InterMine

There are dozens of interlinked and cross-compatible biological data resources around the world, built with InterMine and registered at registry.intermine.org, covering different organisms and research targets.

Findable Accessible Interoperable Reusable

F

- F1.** (meta)data are assigned a globally unique and persistent identifier
- F2.** data are described with rich metadata
- F3.** metadata clearly and explicitly include the identifier of the data it describes
- F4.** (meta)data are registered or indexed in a searchable resource

A

- A1.** (meta)data are retrievable by their identifier using a standardized communications protocol
 - A1.1.** the protocol is open, free, and universally implementable
 - A1.2.** the protocol allows for an authentication and authorization procedure, where necessary
 - A1.2.** metadata are accessible, even when the data are no longer available

I

- I1.** (meta)data use a formal, accessible, shared, and broadly applicable language for knowledge representation
 - I2.** (meta)data use vocabularies that follow FAIR principles
 - I3.** (meta)data include qualified references to other (meta)data

R

- R1.** meta(data) are richly described with a plurality of accurate and relevant attributes
 - R1.1.** (meta)data are released with a clear and accessible data usage licenses
 - R1.2.** (meta)data are associated with detailed provenance
 - R1.3.** (meta)data meet domain-relevant community standards

The FAIR Guiding Principles for scientific data management and stewardship
Scientific Data volume 3, Article number: 160018 (2016)

FAIR Principles

The FAIR principles aim to make data more Findable, Accessible, Interoperable and Reusable.

Science is generating data faster than ever before. Reliably storing and retrieving it isn't enough - it's increasingly critical for academia and industry that datasets, produced at different times by different institutions around the globe, can be found, integrated and shared again without days of laborious manual effort. Hence, the FAIR guidelines - to make data findable, accessible, interoperable and reusable as shown below - are gaining traction in the life sciences and beyond.

But how do these affect the practical design of software systems? In this poster we will explore how we have interpreted them when developing the InterMine platform.

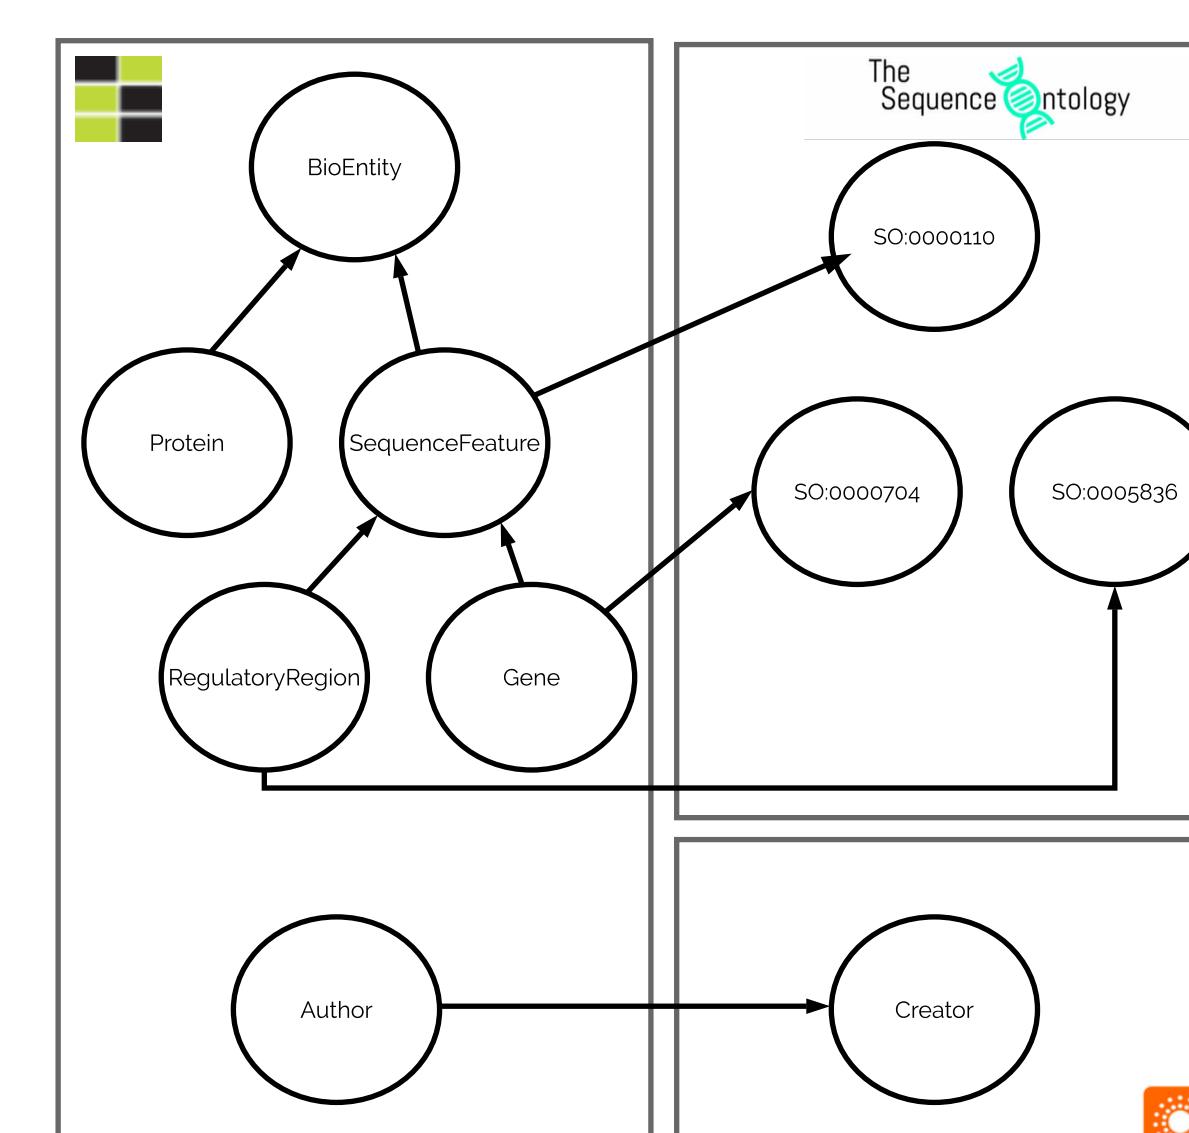

Applying FAIR to InterMine

Generate persistent URIs for data

Current URLs change on every rebuild

Describe data with ontologies

InterMine is based on a generic data model describing classes and their relationships. These descriptions are currently simple labels ("gene", "chromosome", "located_on", etc.). To improve interoperability we will supplement these with terms from ontologies such as the Sequence Ontology (biological sequence features), as used by other data resources.

Markup our web pages

Apply markup (standardized through bioschemas.org) to our data webpages. Search engines can then find it and give more relevant results to users.
